Tomb Raider Linux Launcher Database

This database is designed for the Tomb Raider Linux Launcher and contains data scraped from trle.net for offline access to the website. It includes information on TRLE maps and provides URLs along with MD5 checksums for some of the content available on the site. This database is not intended as a backup of the website; rather, it facilitates offline browsing in a manner similar to using the website online.

The database does not incorporate any authentication mechanisms or user accounts, and it does not include stored procedures. It is intended to be opened in read-only mode, utilizing an MD5 checksum to validate the database file and prevent unauthorized modifications after the program is compiled. While the data is considered public information, users retain the right to contact me to request the removal of their data.
